

Process Model

Agile method which is an approach based on delivering requirements iteratively and incrementally throughout the work seems to be appropriate for our project.

Reasons:

- Number of team members is limited and working environment is the same for all.
- Size of the project itself is small and the speed of development can be increased by using this method.
- During the development team members can be aware of all the changes and in the case some member exits the group there won't be a major problem.
- System evolution is possible and we may add some new features in the future.
